

## Using Keyboard Shortcuts in FlexTk GUI Application

One of the problems of the FlexTk's GUI application is that some good features are deeply buried (or completely missing) in the product documentation so almost none is aware of their existence. For example, there are many types of customizable keyboard shortcuts that may be used to perform frequently used operations, execute user-defined commands or even navigate through the file system using keyboard shortcuts associated with file system bookmarks.

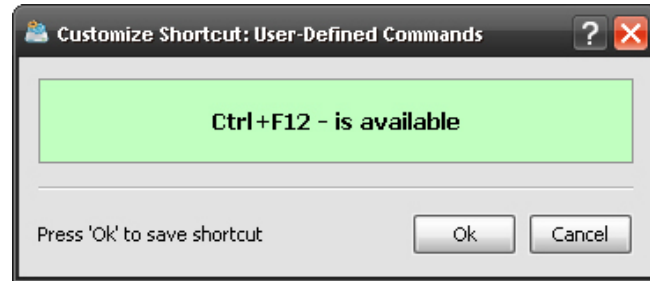

A list of program-wide keyboard shortcuts may be viewed and customized on the 'Options' dialog. Select the menu 'Tools - FlexTk Options' to open the 'Options' dialog and here select the 'Shortcuts' tab to see the list of available program-wide keyboard shortcuts. In order to customize a keyboard shortcut, click on a shortcut item in the list, press a custom key sequence and press the 'Ok' button to save your custom keyboard shortcut.

Another option to use custom keyboard shortcuts is to execute user-defined commands. FlexTk's user-defined commands are custom file management operations, which may be pre-configured to perform user-specified file management operations on specific files or directories. There are numerous ways to execute user-defined commands including the commands management dialog, the commands tool pane or direct desktop shortcuts. As an additional option, FlexTk allows one to set a custom keyboard shortcut for any user-defined command.

In order to set a custom keyboard shortcut for a user-defined file management command, open the commands management dialog, select the required command item, press the right mouse button and select the 'Set Keyboard Shortcut' menu item. On the keyboard shortcut dialog, press a custom key sequence and click the 'Ok' button. Now, just press your custom keyboard shortcut and the command will be automatically executed.

Finally, there is an option to navigate through the file system using keyboard shortcuts associated with file system bookmarks. In order to set a custom keyboard shortcut for a file system bookmark, select the menu 'Bookmarks - Manage Bookmarks', click on the required bookmark item, click the 'Set Shortcut' button and press a custom key sequence. Now, just press your custom keyboard shortcut and FlexTk will automatically navigate to the file system location associated with the file system bookmark.
